

VI/VIM

Tuesday, October 27, 2015 9:11 PM

10/27/2015

VI apparently *is* VIM in most modern setups.

If I ever want to use VIM again, I should read this page: <http://statico.github.io/vim.html>

- First setup
 - touch ~/.vimrc
 - vim ~/.vimrc
 - Type "syntax on" on the first line to get syntax highlighting.
 - Type "set number" to have line numbers on.
 - Type "set ai" to have auto-indenting on for programming. I believe this only tabs in newlines at the tab-level of the last line, i.e. it doesn't tab in the next line if the previous line ended in "{".
 - Monokai color scheme
 - git clone <https://github.com/sickill/vim-monokai.git>
 - mkdir -p ~/.vim/colors
 - cp vim-monokai/colors/monokai.vim ~/.vim/colors
 - rm -rf vim-monokai <-- this deletes the repo
 - vim ~/.vimrc
 - Add "colorscheme monokai" in here.
- Shortcuts
 - = is for indentation, so you can enter visual-line mode with shift+V and then press = to fix indentation.
- Commands
 - In general: ":set foo" will turn something on, and ":set nofoo" will turn it off.
 - "syntax on" is all you need to have syntax highlighting turned on based on the file extension.
 - ":set paste" and ":set nopaste" can be used when pasting things in a terminal, that way you don't get weird tabbing (as pasting will actually type out each character individually).
